

Reminding you of the importance of learning styles

A learning style is not a performance measurement.

Knowing and understanding learning styles enables students to better manage their learning activities and equips clinical and university professors to individualize the instruction they provide.

It also facilitates dialogue between learners and educators and may well enhance respect for differences.

In the business world, knowing about learning styles helps managers build efficient, diversified work teams.

To fully grasp the idea of learning styles, you need to understand the experiential learning cycle, which gave rise to this concept.

This text on the importance of learning styles for supervision is from an article published in *The Clinical Education Express*, 3rd edition, September 2001. It was written by CNFS development advisors JoAnne Paradis, M.O.A., O(C), Reg. CASLPO, and Manon Tremblay, M.A., erg (aut) (Ont.).
